Personal impressions

[p. 3](#)

We have a new marine waters technician: Allison Brownlee!

Climate influences

[p. 5](#)

The spring has generally been wet. River flows are all above normal due to snow melt and warmer air temperatures.

Water column

[p. 8](#)

Record winter and spring rains have created significantly fresher conditions.

Aerial photography

[p. 10](#)

Yellow-green blooms in bays near the Kitsap Peninsula. Blooms in green, brown, and red brown near estuaries of the Skagit, Stillaguamish, and Puyallup Rivers. Red blooms in rivers of Willapa Bay.

Streams

[p. 34](#)

Cold and wet conditions in the first half of 2017 have set the stage for a favorable supply of freshwater to the marine environment.

What types of data do we collect below the surface?

We have a new marine technician! Allison Brownlee has come from the City of San Diego where she collected and analyzed oceanographic data for their expansive ocean monitoring program. Allison joins Mya Keyzers in the marine waters field crew who monitor Puget Sound and the coastal estuaries by both sea plane and boat!

We use a SeaBird CTD (Conductivity, Temperature, Depth) profiler with added sensors to measure a suite of water column parameters:

- Temperature
- Salinity/Conductivity
- Dissolved oxygen
- PAR (Light)
- Transmissivity
- Fluorometry
- Turbidity
- pH

Surrounding the sensors are water-sampling Niskin bottles that we can program to collect water samples at discrete depths. We analyze:

- Nutrients
- Chlorophyll *a*
- TN (Total nitrogen)
- TOC (Total organic carbon)
- POC (Particulate organic carbon)
- PN (Particulate organic nitrogen)
- Dissolved oxygen
- Salinity

Critter of the Month – The Tube-Dwelling Anemone

Dany Burgess & Angela Eagleston
Marine Sediment Monitoring Team

Pachycerianthus fimbriatus

Puget Sound is blooming with plankton right now, and this month's flower-like critter is a reminder that the benthos has "blooms" of its own! Meet the tube-dwelling anemone, a delicate blossom at the bottom of Puget Sound.

Fun Facts!

- The only tube anemone found in Puget Sound
- Secretes a thread-like material to create its own black, slimy tube
- Main predator is the giant nudibranch (photo below)
- Can live up to 10 years

Climate and natural influences, including weather, rivers, and the adjacent ocean, can affect our marine waters. Graphics are based on provisional data and are subject to change. http://www.ecy.wa.gov/programs/eap/mar_wat/weather.html, page 26.

Summary:

Air temperatures have been slightly warmer after a cool winter/spring.

Precipitation levels have been near normal, capping a wet spring.

Sunshine levels have been above normal except near the coast (opposite of cloud cover).

River flows are all above normal due to snow melt and warmer temperatures.

Downwelling has been strong, though normal in May. ENSO and PDO are trending warmer.

*Upwelling Anomalies (PFEL)

PDO = Pacific Decadal Oscillation

NPGO = North Pacific Gyre Oscillation

ENSO = El Niño Southern Oscillation

higher expected lower No data

Station network of ambient
water quality monitoring stations

We use a boat and a chartered float plane equipped with a CTD package to access our monthly monitoring stations.

Start here

We communicate data and environmental marine conditions using:

1. Marine Water Condition Index (MWCI)
2. Eyes Over Puget Sound (EOPS)
3. Anomalies and source data

Year 2016 had record-breaking global temperatures. **The year 2017 is looking much better.** Frazer River flows are normal or higher than normal in June and similar to the year 2014. **This means that water renewal in Puget Sound has returned to normal conditions this early summer.**

Streams

With the onset of 2017, the remarkably high water temperatures from 2015 & 2016 disappeared except in South Hood Canal deep water. **Record winter and spring rains** have created significantly fresher conditions. Bad weather from Jan. – Apr., 2017 caused us to miss quite a few stations. In addition, our rigorous QA/QC caught some sensor issues in oxygen, resulting in data gaps.

Cooler Temperature

Lower Salinity

DO Sensor Issues

Red = higher than expected ($>IQR$, $n=13$)
 Red = higher than previous measurements

Black = expected ($=IQR$, $n=13$)
 Gray = no data

Green = lower than expected ($<IQR$, $n=13$)
 Green = lower than previous measurements

The ocean affects water quality: Ocean Climate Indices

[Field log](#)[Climate](#)[Water column](#)[Aerial photos](#)[-](#)[Streams](#)

- a) Pacific Decadal Oscillation Index (**PDO, temperature**) [\(explanation\)](#)
- b) Upwelling Index (anomalies) (**Upwelling, low oxygen**) [\(explanation\)](#)
- c) North Pacific Gyre Oscillation Index (**NPGO, productivity**) [\(explanation\)](#)

Three-year running average of PDO, Upwelling, and NPGO indices scores

Ocean boundary conditions long-term variability: (a) water is still warm (PDO), (b) upwelling of low oxygen and high nutrient ocean water are low (Upwelling Index anomaly), and (c) surface productivity along the coast is near normal (NPGO).

Some jellyfish aggregations in finger inlets of South Sound. Unusual yellow-green blooms in bays near the Kitsap Peninsula. Blooms in green, brown and red brown near estuaries of the Skagit, Stillaguamish and Puyallup Rivers. Red blooms in some rivers of Willapa Bay at the coast.

Mixing and Fronts:

Tidal eddies near Hope Island, numerous internal waves in Whidbey Basin.

Jellyfish:

Some patches in Budd, Eld, Totten, and Sinclair Inlets.

Suspended sediment:

Glacial flour near the Skagit and Puyallup rivers.

Visible blooms:

Red-brown blooms in Commencement, Port Townsend Bays. Yellow green blooms in Oyster Bay and parts of Liberty bay, Red bloom in rivers of Willapa Bay. Dark green water in Puget Sound suggesting high productivity.

Debris:

Macro-algae in Dyes Inlet, Colvos Passage and Pickering Passage.

Tyler Burks,
Ecology

Cold and wet conditions in the first half of 2017 has set the stage for a favorable supply of freshwater to the marine environment. Key things to watch for in the coming months will be snowpack melt rates, and also how rain-dominated watersheds respond as we progress through the summer.

A.

B.

A. During the first half of water year conditions were favorable for a building snowpack and predominantly above normal streamflow conditions.

Precipitation reached nearly 200% of normal in parts of Puget Sound, while temperatures ranged from normal to 2 °F below normal.

B. Presently, a cool spring has allowed the snowpack to persist at an average of 160% for watersheds draining to Puget Sound.

C.

Comparison of May Monthly Streamflow, 2016 and 2017

C. In 2016, despite near normal snowpack conditions at higher elevations, a very warm spring lead to early streamflow peaks and eventual deficits in Puget Sound. By May of last year (left) streamflow had already reached levels below the 10th percentile, while in other areas streamflow remained normal.

In 2017 (right), due to a robust snowpack and mild spring temperatures, streamflow conditions have ranged from normal to much above normal for watersheds draining to Puget Sound.
